ABSTRACT

According to some embodiments, a plurality of codes are printed on an identification card. For example, the identification card may have visible information printed on an identification card surface, and a first code may be printed on the same area of the identification card surface as the visible information. A second code may be printed on the identification card surface remote from the first code, and a third code may be printed on another side of the identification card. Moreover, the first, second, and third codes may be (i) identical to each other, (ii) associated with the card holder, (iii) machine readable bar codes that are substantially invisible to a human, and/or (iv) printed using the same technology.
